

Lab 6

Create a program that will allow a user to insert new rows into the ZNAUS24_LAB6 table. Your program should allow the user to enter an employee ID number, an employee first name, and employee last name, and the employee salary.

You will need to use the SE16 (data browser) transaction to see the field names and data already in the table.

Make sure your input screen looks nice and be sure to include the sy-subrc variable error handling so the user knows whether or not their record was successfully inserted into the table.

When your program is complete, make sure it is activated and submit a text version in Canvas.
