BAN410/510 Individual Lab 10

Below you will find the code for a simple program. When run, the program will display data from the ZNAUS24_CUSTOMER database table. The program will display the first name, last name, email and phone number of the customers in the table. Copy the program code into a new ABAP program and modify it as follows:

1) Make the program display only the customer first and last names on the first output screen.
2) Create a drill-down navigation event which displays customer email and phone number on a new output screen when a user double-clicks on one of the customer names on the original output screen.
3) If the user double-clicks on the email or phone number on the second report screen, a banner message should display at the bottom of the screen informing the user that no further details are available.

When your program is finished, activate it and paste a text version in Canvas.

```
TYPES: BEGIN OF customer,
        first_name LIKE znaus24_customer-first_name,
        last_name  LIKE znaus24_customer-last_name,
        cust_email LIKE znaus24_customer-cust_email,
        cust_phone LIKE znaus24_customer-cust_phone,
      END OF customer.

DATA: itab_customer TYPE STANDARD TABLE OF customer,
      wa_customer   TYPE customer.

SELECT first_name last_name cust_email cust_phone
FROM znaus24_customer INTO TABLE itab_customer.

LOOP AT itab_customer INTO wa_customer.
  WRITE: / wa_customer-first_name, wa_customer-last_name, wa_customer-cust_email, wa_customer-cust_phone.
ENDLOOP.
```
